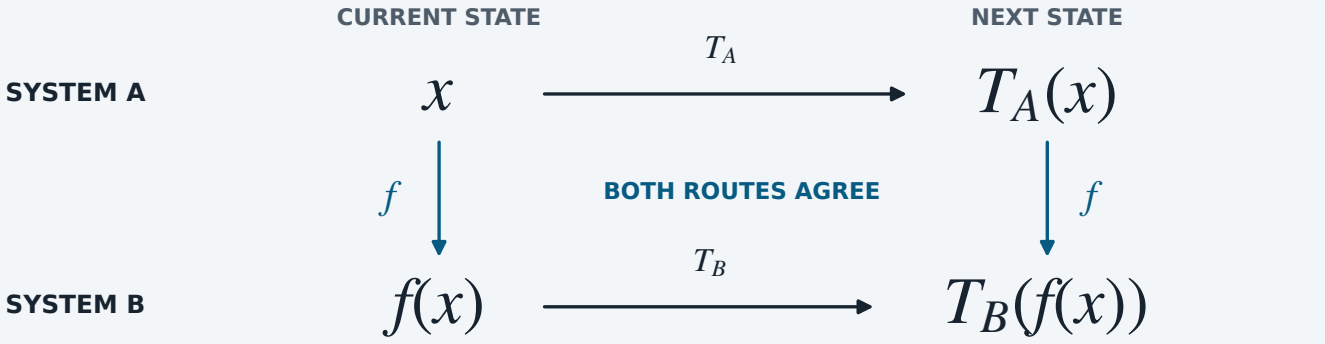
When status crosses a domain boundary

Standing follows the justification preserved by the mapping.

01 / VERIFY WHAT THE CLAIM DEPENDS ON

Preserve the transition. Carry the invariant.

A sufficient formal case: a bijection preserves the state transition.



For a bijection $f: A \to B$ and transitions T_A, T_B, require:

$$f(T_A(x)) = T_B(f(x)) \quad (\forall x \in A)$$

An invariant is an unchanged quantity: $I_A(T_A(x)) = I_A(x)$.

Define $I_B = I_A \circ f^{-1}$. For $y = f(x)$, the proof carries across:

$$I_B(T_B(y)) = I_A(T_A(x)) = I_A(x) = I_B(y)$$

02 / WHAT CAN CARRY ACROSS

SOURCE BASIS	TARGET STANDING
Structural proof	Mapped conclusion follows under the preserved hypotheses.
Empirical finding	Applicability needs evidence; source uncertainty remains.
Resemblance	Candidate correspondence; target validity remains unresolved.

hmmm / CURRENT IMPLEMENTATION [2]

The classifier stores a proof ID without checking the proof.
Transfer flags stay false, even for SAME_STRUCTURE.

[1] Chapter Zero, Theorem 7.
